```
# I'm curious about the value counts for o-ring failures
table(data$O.ring)
```

```
##
##  0  1  2
## 16  5  2
```

Initial findings:

- 23 data points with no missing values for any variables
- Dependent variable, O.ring, is categorical and takes three values: 0, 1, and 2 representing the number of o-ring failures on space launches. The mean value is 0.3913 which means the data is skewed towards 0 o-ring failures. Futher investigation shows there were 2 flights with 2 o-ring failures, 5 with 1 failure, and 16 with no failures.
- The explanatory variables are as follows:
  - Temp: temperature at launch (degrees F)
  - Pressure: Combustion pression (psi)

```
par(mfrow = c(3,2))

# histogram of explanatory variables
for (i in 2:4){
  hist(as.numeric(data[,i]), main=paste0("Histogram of ", colnames(data)[i]), xlab=NA)
  hist(as.numeric(log(data[,i])), main=paste0("Histogram of log(", colnames(data)[i], ")"), xlab=NA)
}
```
